

Applicant's Name: **Pavel Macholda**
Title of the Invention: **Aggregate Activation System**
Date of Application: **December 17, 2001**

Abstract of the disclosure

The aggregate activation system uses keywords to activate digital or analog devices, connect licensees with each other, and authorize transfer of information or content between or among the authorized devices for the use of the licensees according to the relationship defined by the selection of activation keywords. The aggregate activation system allows the licensees to pass the licenses onto new members based on the keyword syntax, and to create clusters of licensed devices and users, according to the guidelines set by the general licensor, based on the selection of identical activation keywords.
